Fantasy RPG UI Pack

Hand-painted interface artwork for an old-school fantasy RPG: panels, decorative frames, icons, buttons, scrollbars, resource bars and skill panels. Use the supplied Canvas prefabs or UI Toolkit templates, then connect your game data and actions.

Choose your demo

UI Toolkit Gallery: browse all 498 prefab presentations. Search by name or open the grouped folders. Natural size keeps small icons from filling the screen; the scale selector also offers up to 200% or fit-to-area. Resource % updates the displayed bars.

Healthbar Comparison: explore 40 compositions in Canvas and UI Toolkit, with painted and animated variants. Choose a preset, UI system and presentation, then use Resource %, Empty, Full, Damage 10% or Heal 10%.

DemoScene: the original Canvas showcase. Space moves to the next panel. Left / Right drain or fill health bars; Up / Down set full or empty; R chooses a random value.

Project requirements

This edition targets Unity 6000.3.9f1. The supplied project uses the Built-in Render Pipeline. Shader Graph 17.3 and its rendering-package dependencies provide the custom shader sources and includes. Unity UI (uGUI) 2.0.0 is used for Canvas assets. Keep the TextMesh Pro resources required by existing prefabs.

URP, HDRP, earlier Unity versions and other platforms require separate validation. Installing a rendering package does not automatically change the active render pipeline.

The pack supplies UI artwork and resource controls. It is not a complete inventory, equipment, skill progression or save-game system.

Find and customise your assets

```
Prefabs/Painted/          Painted Canvas assets
UI Toolkit/Templates/Painted/   Painted layouts
UI Toolkit/Support/       Clip data and masked artwork
Prefabs/Animated/         Animated Canvas bars
UI Toolkit/Templates/Animated/  Animated layouts
Shader Variants/Materials/ Effect materials
Shaders/Compatible/       Current effect shaders
PNG/ and PSD/             Artwork and editable sources
Scenes/                   Three interactive demos
Scripts/Runtime/          Components for your game
Scripts/Demo/             Showcase controllers/catalogs
Documentation/            README and integration guides
```

Painted proportions

The artwork is not designed for 9-slice. Resize whole compositions uniformly, or rearrange independent pieces. PaintedFrame preserves the authored aspect ratio. Keep the original layer transforms, masks and edge relationships.

Toolkit support files

Support contains PaintedClipShape assets and masked images referenced by the templates. These are runtime resources, not temporary generation files. FantasyUI.uss supplies styles; FantasyTheme.tss and FantasyPanelSettings configure the document. FantasyUICatalog drives the full gallery.

Colours and effects

Duplicate an asset before customising it. Duplicate shared materials if the change should affect only one preset. Canvas and Toolkit use separate shader materials. Editing a Shader Graph does not automatically update the supplied Toolkit shader adapter.

Original shader sources are retained for existing users. Start new effect work with Shaders/Compatible. The supplied Toolkit renderer expects standalone sprites; repacked or rotated Sprite Atlas entries require separate support.

Fonts

Keep the font files and accompanying licence notices supplied with the pack. Font and artwork usage remains subject to the applicable licences.

Connect resource values

Canvas / uGUI

Place a prefab under a Canvas and reference its HealthBarUGUI component. Values are resource units: 75 out of 150 means half full. Each resource in a multi-bar panel has its own controller.

```
using MoonTribe.UI;

// bar is a HealthBarUGUI reference.
bar.SetMax(150);
bar.SetValueInstant(150);
bar.Damage(25);
bar.Heal(10);
bar.SetValue(75); // Smooth transition.
```

UI Toolkit

Assign Panel Settings to a UIDocument. Instantiate the chosen VisualTreeAsset into its root, then query its HealthBarElement. Use a named query for panels with more than one resource.

```
using MoonTribe.UI;
using UnityEngine.UIElements;

var view = template.Instantiate();
view.style.flexGrow = 1;
document.rootVisualElement.Add(view);
var bar = view.Q<HealthBarElement>();
bar.SetMax(150);
bar.SetValue(75, instant: true);
```

SetValue animates; an instant update snaps to the target. Empty/full events describe logical boundaries, while normalized-change events describe the displayed fill. Linear bars fill horizontally; round bars use a vertical liquid level. Moving edge artwork follows that boundary.

See Documentation/Quick Start.md and Healthbar Variants.md for event behaviour, multi-resource panels, masks and scrollbar integration.

Scripts included in the pack

Resource controls

HealthBarModel.cs stores and smooths resource values. HealthBarUGUI.cs connects them to Canvas images and UnityEvents. HealthBarElement.cs provides the Toolkit equivalent and its scheduled updates.

Toolkit rendering

PaintedImage.cs draws sprite layers and optional material effects. PaintedClipShape.cs stores silhouette clipping data. PaintedFrame.cs preserves composition proportions. PaintedScrollbar.cs supplies dragging, track clicks and keyboard/value controls; connect its normalized value to your own scrollable content.

Full gallery

FantasyUICatalog.cs maps preset names to templates. FantasyUIGallery.cs supplies search, folders, preview scaling and resource controls for the 498-entry gallery.

Healthbar comparison

HealthbarVariantCatalog.cs pairs the four presentations. HealthbarComparison.cs creates the demo controls. HealthbarCanvasPreview.cs renders Canvas prefabs for this demo; it is not needed in a regular Canvas HUD.

Original Canvas demo

mr_GM.cs changes panels. Healthbartester.cs contains HealthBarTester, which drives resources with the keyboard and displays on-screen help. Both are used by DemoScene.

All new UI classes use the MoonTribe.UI namespace. The original mr_GM demo controller uses DarkRPGUI. Runtime contains reusable controls and rendering. Demo contains showcase controllers and catalogs. Keep Demo when using the included scenes.

Troubleshooting & support

A bar does not respond

Check the controller reference and maximum value. For a skill or character panel, select the intended child resource rather than the first controller found.

Art stretches or the fill escapes its frame

Restore the authored layer transforms and keep masks in place. Resize the complete composition uniformly. Changes to mask geometry require matching clip data.

A Toolkit element is invisible

Check the UIDocument Panel Settings and parent size. Retain the referenced styles, Support assets and rendering scripts.

A shader is pink or an effect is missing

Check Console errors, Shader Graph dependencies and the selected material family. The supplied project is configured for Built-in; other render pipelines need separate verification.

A scrollbar does not scroll my inventory

The painted scrollbar exposes a normalized value and input behaviour. Connect its value-change callback to your own scrolling logic; the pack does not provide a complete inventory system.

Support

info@moon-t.com
assetstore.unity.com/publishers/19428

Include your Unity version, render pipeline, prefab or template name, steps to reproduce and Console errors when reporting an issue. Back up your project before importing an update. Use and redistribution are governed by the licence supplied with your purchase.
